

Model 18590-Series

SELF-PRIMING MACERATOR PUMP FEATURES

- Pump:** Self-Priming Flexible Impeller with Stainless Steel Wearplate
- Impeller:** Jabsco Nitrile compound
- Macerator:** Stainless Steel Cutter reduces particle size to 1/8" (3mm) maximum
- Seal:** Lip Type
- Ports:** Inlet - 1-1/2" (38mm) Hose Barb and 1-1/2" N.P.T. (Male)
Outlet - 1" (19mm) Hose Barb
- Motor:** Permanent Magnet Type, Fully Enclosed, with Stainless Steel Shaft Complies with USCG Regulation 183.410 and ISO 8846 MARINE for Ignition Protection
- Weight:** 5 lb (2,3 kg) Approx.

VARIATIONS AVAILABLE

MODEL NO.	DESCRIPTION
18590-0000	12 Volt
18590-0090	12 Volt EMC CE
18590-0001	24 Volt
18590-0091	24 Volt EMC CE

APPLICATION

The JABSCO 18590 series dc macerator pump unit is the ideal solution for emptying marine holding tanks when not in a discharge restricted area. The JABSCO macerator is self-priming to a five foot lift when impeller is wet, four foot when dry, and may be mounted in any convenient point in the waste discharge system. The macerator section grinds waste down to a particle size of 1/8" (3mm) maximum so it can easily be pumped through a 1" (19mm) ID discharge hose. The pump section is self-priming, permitting the unit to be mounted above the tank in a convenient location. (For optimal efficiency, locate pump as close to holding tank as possible.)

The macerator has an approximate flow rate of 12 GPM (45 LPM) and will empty a typical 30 gallon (115 litre) holding tank in less than 3 minutes.

The 18590 series waste pump will macerate and pump all waste and tissue normally found in marine and recreational vehicle waste systems.

Model: 18590-Series

The pumps should be used in accordance with EPA, USCG Marine Sanitation Regulations, and any regional or local ordinances.

Motors meet USCG Electrical Regulation Title 33, Chapter 1, Part 183; Subpart 1 and ISO 8846 MARINE for IGNITION PROTECTION.

OPERATING INSTRUCTIONS

The macerator should be controlled by a momentary switch (push and hold) positioned close enough to the pump so it can be heard while operating. When the tank is empty there will be a change in pump noise (louder, higher frequency) at which time the macerator should immediately be switched off.

The macerator pump unit has been designed to handle waste, toilet tissue, and facial tissue. It will also handle

solids such as cigarettes, cigars and chunks of soft fruits or vegetables less than 1" size. It will not pump solid objects like fruit pits, rags, wet strength kitchen towels, tampons or sanitary napkins. The holding tank and pump should be flushed with several gallons of water after each pumpout.

Do NOT run pump dry longer than 30 seconds or impeller and pump damage may result. Make sure the battery is fully charged. The dc motor is suitable only for intermittent duty and should not be run for more than 15 minutes continuously. At maximum flow of 12 GPM (45 LPM) the macerator can empty a 180 gallon (680 litre) holding tank in a single operation.

After long periods of nonuse, the flexible impeller may stick to the pump body preventing the macerator pump from turning freely. If this occurs, the impeller can be broken free by removing the plastic cap on the shaft at the rear end of the motor, inserting a screwdriver in the slot and rotating the shaft clockwise a quarter turn or more. When impeller is broken free, reinstall the plastic cap on the motor shaft.

INSTALLATION INSTRUCTIONS

Locating the Pump: The JABSCO macerator is self-priming to a five foot lift when impeller is wet, four foot when dry, and may be mounted in any convenient point in the waste discharge system. It may be mounted in any position or angle without affecting performance. If mounted vertically the motor should be above the pumphead. Use the rubber grommets provided to absorb vibration. Do not overtighten mounting screws. For optimal performance, mount the pump as close to tank as possible.

Plumbing Connections: Use 1-1/2" (38mm) ID noncollapsible waste type suction hose. Slip the hose over the inlet hose barb and secure it with two stainless steel hose clamps.

The macerator may also be screwed directly into a 1-1/2" N.P.T. tank flange or female pipe fitting. If attaching the inlet port to a pipe fitting it may require removing the hose barb portion of the port with a hack-saw. If this is necessary, cut across the hose barb portion of the port about 1/8 inch (3mm) away from the end of the pipe threads. Wrap port threads with a couple wraps of Teflon* tape and screw the pump assembly into the pipe fitting. Tighten hand tight, do not overtighten.

NOTICE: An air leak anywhere in the suction side of the plumbing system can cause extended dry running which may result in damage to the impeller and pump.

All suction connections must be airtight and free of sharp bends or restrictions. If a waste deck fitting is installed (for dockside pump-out), it too must be airtight to

ensure proper priming. Make certain there are no air leaks around the deck plate cap or hose tail. Use minimum 1" (19mm) ID hose for discharge and connect to thru-hull fitting located approximately 4-6 inches above waterline.

NOTICE: The discharge thru-hull may be positioned below the waterline only if the discharge hose has a vented loop fitting installed at least 8" above the waterline at all angles of heel or trim. Consult with a qualified marine plumber.

* Teflon is a registered trademark of E.I. DuPont de Nemours and Company.

WIRING

NOTICE: Correct motor polarity (orange to positive, black to negative) is important. Reverse polarity can damage motor and void warranty.

Full voltage at the motor is required to properly operate the macerator. It must be wired in a circuit independent of all other accessories.

Use stranded copper wire of the correct size (determined from the electrical specifications chart) to connect the macerator to the power source. Undersized wire will cause a reduction of voltage that may cause the pump to seize or damage the motor. An appropriate size fuse or equivalent circuit breaker (determined from electrical specifications chart) must be installed in the positive power lead within seven inches of the power source. Alternatively the macerator may be wired to a properly installed over-current protecting electrical distribution panel. Connect the positive lead to a heavy-duty momentary switch (push and hold) (see required switch amperage rating in electrical specifications chart) positioned close enough to the macerator so the operator can hear the macerator while it is running. Continue the positive lead from the switch to the macerator and connect it to the orange (positive) motor lead. Connect the black (negative) motor lead to the negative side of the battery or grounded buss bar.

ELECTRICAL SPECIFICATIONS

VOLTAGE	AMP DRAW	FUSE SIZE	Switch Rating	WIRE SIZE PER FEET OF RUN*				
				0'-10'	10'-15'	15'-25'	25'-40'	40'-60'
12 Vdc	16	20		#12 (4)	#10 (6)	#10 (6)	#8 (10)	#6 (16)
24 Vdc	8	15		#16 (1.5)	#14 (2.5)	#12 (4)	#10 (6)	#10 (6)

* Length of run is total of the circuit from the power source to product and back to ground.

HEAD CAPACITY TABLE†

Head Ft	GPM	AMPS	
		12 volt	24 volt
Free flow	12.5	14.0	7.6
5	11.5	14.5	7.8
10	10.5	15.0	8.1
15	9.0	16.0	8.6
20	7.5	16.5	8.9

† Flow rates and amperage will vary slightly depending on pump loading (sanitation system design).

For technical advice or service please take your pump into your local pump service center.
