ELECTRIC WATER SYSTEM PUMP
Automatic Multi-Outlet

FEATURES

• Self-Priming
• Diaphragm Design Allows Dry Running
• Built-in Discharge Check Valve
• Quiet Operation
• Built-in Hydraulic Pulsation Dampener
• Large Vibration Absorbing Pads
• Ports Available with Barb, Threads or Flare
• Meets USCG Regulation 183.410 and ISO 8846 MARINE for Ignition Protection

* Customer supplied, not included with pump.

APPLICATIONS

Jabsco automatic water system pumps are designed for self-contained recreational vehicles and pleasure boats with multiple-outlet water systems. The systems are automatic - when a faucet is opened, the pump instantly begins operation to provide a constant flow from tank to faucet. Closing the faucet automatically discontinues pump operation.
MOUNTING
Jabsco diaphragm pumps are self-priming. They may be located above or below the fresh water tank. The pump is equipped with vibration pads which are most effective when the pump is mounted upright on a solid surface.

PLUMBING
To minimize water pressure drop, the size of water supply line should not be less than sizes shown in the table below. Valves, elbows, etc. used should be the same size as pipe or tubing. Use full opening (gate or ball type) valves only. Fresh water tank must be vented.

### MINIMUM PIPING SIZE

<table>
<thead>
<tr>
<th>Supply Line Length</th>
<th>Hose ID</th>
<th>Pipe Size</th>

<tr>
<td>Less than 48&quot;</td>
<td>1/2&quot;</td>
<td>3/8&quot;</td>
</tr>
<tr>
<td>48&quot; or more</td>
<td>5/8&quot;</td>
<td>1/2&quot;</td>
</tr>
</tbody>
</table>

PRESSURE REGULATOR. It is recommended that systems having a connection for city water be equipped with a pressure regulator set at approximately 35 psi. This valve automatically regulates the incoming water pressure to avoid damage to the pump and plumbing from excessive pressures. Model 44410-1000 (permanent flush mount) and Model 44410-1010 (in-line) pressure regulating valves are recommended for this purpose.

SUCTION FILTER. A Model 36400-0000 (strainer/filter) is recommended to be installed between the pump and fresh water tank. It helps prevent valve clogging caused by foreign material entering the pump.

WATER PURIFIER. Many water purifiers cause excessive restriction to flow, especially when element is in use for some time. When used at the main distribution line it causes the pump to cycle on and off rapidly. To minimize cycling, use an accumulator tank between pump and purifier, install purifier to feed a single outlet for drinking-water only.

ACCUMULATOR TANK. The use of an accumulator tank (Jabsco Model 30573-0000, 12573-2000 or 18810-0000), although not required, is recommended for a more effective water distribution system. It eliminates "water hammer," stores pressures to allow a limited use of water without restarting pump (desirable at night-time), assures a constant, even stream of water at faucets farthest from pump and prolongs pump life by cutting down rapid start/stop operation.

WIRING

WIRING DIAGRAM

Pump should be wired in an independent circuit according to the wiring diagram.

WIRE SIZE CHART (AWG-COPPER)

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Up to 80'</th>
<th>80' to 100'</th>
<th>100' to 150'</th>

MOTOR PROTECTION. The pump wiring must include a fuse/breaker in the positive lead to protect against overcurrent draw. See specification table for proper fuse rating.

SWITCHES. An on-off switch must be installed in the circuit to turn off pump when vehicle or boat is unattended, stored, in transit, or connected to city water. Use red and white label included as a reminder to shut off pump and relieve pressure in water system when idle.

AC-DC POWER CONVERTERS. AC-DC converter/charger packs should be wired to operate pump directly from the battery at all times. If the battery is bypassed and converter is used to service the pump directly, be sure the total electrical loads do not exceed the converter amp rating. Overloading the converter could result in low-voltage condition.

VOLTAGE CHECK. After installation, check the voltage at the pump motor. Voltage should be checked when pump is operating along with the inside electrical fixtures. Full voltage must be available at the pump motor at all times.
OPERATION

- Check water level in tank. Be sure valves are open and strainers and aerator are clean.
- Open all faucets, hot and cold.
- Turn on power to pump.
- Close each faucet when it starts to deliver a steady stream of water (close cold water first).
- Observe the pump. Check to be sure pump stops soon after all faucets are closed.
- Pump is now ready for automatic operation. It will start when a faucet is opened and stop when the faucet is closed.
- Turn off power to pump and open faucet to relieve pressure in system before hooking up to city water and when unattended.

MAINTENANCE

WINTER STORAGE. The Jabsco pump, with its unique pulsation damper, will withstand frozen water without damage provided the system is properly drained. The following directions are intended for use with the Jabsco pump and are built into the vehicle manufacturer's instruction handbook:

1. Open all faucets and allow pump to empty water tanks and intake lines. Run pump dry for 1 to 2 minutes before turning off.
2. Open all drains and blow air through city water entry. Allow time for water heater to empty.
3. Disconnect discharge and intake hoses from pump. Start pump and allow to run until all water is expelled from unit. (Running dry will not harm the pump).
4. Reconnect the hoses, close the drains and leave faucets open. The water distribution system is now dry and ready for winter storage.

An alternate method is to use potable water system anti-freeze solution. Follow directions of anti-freeze manufacturer.

DANGER: DO NOT USE AUTOMOTIVE TYPE RADIATOR ANTI-FREEZE. IT IS POISONOUS. USE OF THIS TYPE OF ANTI-FREEZE WILL CAUSE SERIOUS INTERNAL INJURY OR DEATH.

SERVICE

TROUBLESHOOTING

<table>
<thead>
<tr>
<th>Problem</th>
<th>Causes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pump operates but no water flows through faucet.</td>
<td>Low water level in tank.</td>
</tr>
<tr>
<td>Pump cycles on and off when faucets are closed.</td>
<td>Water leak in plumbing.</td>
</tr>
<tr>
<td>Pump operates roughly and has excessive noise and vibration.</td>
<td>Intake line is restricted, kink in suction hose or fittings too small.</td>
</tr>
<tr>
<td>Pump fails to start when faucet is opened.</td>
<td>No voltage to pump.</td>
</tr>
<tr>
<td>Pump fails to stop when faucets are closed.</td>
<td>Very low voltage to pump.</td>
</tr>
</tbody>
</table>

NOTICE: Before servicing pump, turn off power to pump and open faucets to relieve pressure in water system.

VALVES REPLACEMENT

1. Remove motor and four tie down screws.
2. Expose valves by lifting jack shaft and attached diaphragm assembly from pump base.
3. Lift valves from pockets. Clean all foreign materials from valves and seats.
4. Reinstall valves into same pockets, being sure rubber valve with small hole is UP on intake and rubber valve without the small hole is DOWN on discharge (see exploded view).

NOTE: Do not use valve with small hole in rubber on discharge side of pump.

DIAPHRAGM & CONNECTING ROD REPLACEMENT

1. Remove motor and four tie down screws then lift jack shaft and attached diaphragm assembly from pump base.
2. Expose diaphragm by removing two diaphragm ring screws and detached ring.
3. Remove diaphragm screw to separate diaphragm and plates from connecting rod. Inspect diaphragm for cuts and ruptures.
4. Remove lock nut to separate connecting rod from jack shaft.
5. When reassembling, be sure to align diaphragm and connecting rod so that rod slips straight onto jack shaft and diaphragm rests squarely on diaphragm retainer. Misalignment will create a strain on diaphragm and significantly shorten its life. Adjust belt tension to 1/4" play.

* Indicates Parts Contained in Service Kit.
† Indicates Parts Supplied with Base Assembly.
* Except Model 36950-2180

### SERVICE (continued)

#### PULSATION DAMPENER REPLACEMENT
1. Remove pump from installation.
2. Remove nine screws from bottom of base and bottom plate.
3. Loosen screw to slide off small pulley from motor shaft.
4. Inspect dampener for excessive deformation, ruptures and cuts.
5. When installing new pulsation dampener, make sure flange is well-seated to effect a proper water and air seal.

#### SWITCH REPLACEMENT – PROCEDURE A
Direct replacement of switch with threaded stem directly into pump body.
1. Disconnect power leads from switch and remove switch from pump.
2. Moisten rubber side of washer with water. Thread washer onto switch threads with metallic side of washer facing switch.
3. Screw replacement switch into pump base/body until snug.
4. Reconnect switch power leads.

#### SWITCH REPLACEMENT – PROCEDURE B
For pump base-body with flange mount and two screw holes only.
1. Disconnect power leads from switch. Remove two screws on switch flange and save. **CAUTION:** These screws hold down a strong spring. Hold switch firmly. Personal injury could result if switch body is allowed to fly loose. Remove switch housing, spring, plunger and diaphragm from base/body.
2. Remove stem, retainer, and screws from switch and discard leaving switch housing, spring, plunger, and diaphragm.
3. Insert plunger and spring assembly into base/body noting stack-up in diaphragm.
4. Cover with switch housing assembly. Hold firmly and retain with two screws saved from old switch.
5. Reconnect switch power leads.

#### MOTOR REPLACEMENT
1. Disconnect one motor wire from pressure switch terminal, the other from splice connector.
2. Remove two motor nuts to separate motor.
3. Loosen screw to slide off small pulley from motor shaft.
4. When assembling, be sure to adjust belt tension before tightening motor nuts. Proper adjustment is made when belt can be depressed 1/4" at a point halfway between pulleys. Do not overtighten belt.

**NOTE 1 –** Low Pressure Switch 10 (.7) to 20 (1.4) psi
**NOTE 2 –** Includes Switch and Conversion Kit to Mount New Style Switch Onto Older Style-J and -0000 Pumps.
**NOTE 3 –** Replacement Switch only for -2000 Series Pumps.

**NOTE 4 –** Threaded Outlet Port 37050-0001
**NOTE 5 –** Jack shaft assembly kit, with part number ending in 0001 includes new style connecting rod (37173-0001) with a 5/16” diameter hole and two (2) locknuts. Previous model pumps use a connecting rod (37173-0000) with a 1/4” diameter hole and a bolt.
